

What does zero export load mean on a Deye inverter?

Zero Export Load = Delivers PV to essentials and battery, doesn't export to grid or non-essentials  
Zero Export to CT = Delivers PV to essentials, battery and non-essentials, doesn't export to grid. What I have noted was that if Zero Export Load is selected, my Deye inverter only displays under the house icon my essential load on the inverter.

What does zero export to CT mean?

Zero Export to CT = Delivers PV to essentials, battery and non-essentials, doesn't export to grid. What I have noted was that if Zero Export Load is selected, my Deye inverter only displays under the house icon my essential load on the inverter. It ranges from 0.3kw to 0.5kw throughout the day.

Can a Deye export surplus battery power?

I stand to be corrected. It's possible to set up a Deye with Time-of-Use to export surplus battery power anywhere, to the load port (Zero Export to Load), or to the grid port up to the CT coil (Zero Export to CT), or even to the Eskom grid beyond the CT coil (Selling First).

Where is the CT wire on a Deye inverter?

Black wire from CT sensor in port 4. White in port 3 on the inverter. And CT wire is around the L cable on the intake power of the house. I mean where is it clamped? Where are your loads connected? There is a new and popular way of connecting Deye that is NOT according to manual.

Does inverter use a CT sensor?

Inverter uses one or the other and if you select internal CT sensor, zero export will be referenced to inverter AC input port so you will not supplement AC loads in main grid fed panel. CT sensors are not super great in accuracy, so inverters usually hold a margin of error on zero export prevention.

What is a zero export mode?

Zero Export: this tells the inverter to support both essential and non-essential load, but NOT to export anything to the grid. In this mode you can see why we need the CT - the inverter uses the CT to measure flow "at the meter", and attempts to keep this equal to zero. Nothing in, nothing out.

Then set "ZERO EXPORT TO CT" and enable "SOLAR SELL". Adjust "ZERO-EXPORT POWER" around 40 so that Deye has better control over zero point (even 20 might ...

To select a location for the inverter, the following criteria should be considered: **WARNING: Risk of fire** Do not install the inverter in areas containing highly flammable ...

I have a Deye 5kw hybrid inverter with panels and a 5kw battery. I also have the solarman ios app. My

inverter is set to Zero Export to CT as recommended by installers but in that setting the inverter and the app both ...

Spuntando "zero export to CT" dovrebbe produrre solo il necessario per alimentare casa e tramite il ct sentire e tagliare l' afflusso verso la rete. Tuttavia non ha funzionato per ...

Zero Export to CT is similar except that the approach of consumption where the CT is placed approaching Zero Amps plays the role of a battery approaching full charge state in the DC-coupled analogy and the ...

The system works well, except for the export to CT function. When this function is switched on, the total home consumption shows 9.8kw when I do not have anything big switched on (geyser and stove off, only computer and ...

zero export to load:PV/? zero export to CT:PV. 10. Time of use. „01~05, ...

Do someone has solution for let it working the system? Install the CT close to the inverter and as you said use Zero export to load. The Deye NEEDS the CT installed. Port 5+6 ...

I'm in the middle of my installation and have done a lot of research into what is possible or not possible with the Deye inverter. One of my aims is to channel excess PV ...

When I select "Zero Export to CT" - NB "Solar Sell" is not ticked - the behavior I see is that the "home" load jumps as high as 9kw. The PV goes as high as possible - around 4kw, ...

With CT wrong when export to CT is used it will see a positive reading and not knowing it is now exporting and not importing. During the 1st picture the CT sees a negative in red but as export is not stopped it sees it as ...

I have 2 5k deye hybrid inverters in parallel with a ct sensor Connected to the master in slot 3 and 4. When setting max sell 200w its only selling 200w. But when pv is not available it draws 360w from the grid and ct ...

The problem is caused by the distance from the inverter to the CT coil. Nothing else, bring the CT coil closer to the inverter or replace it with a CHINT meter (if your version of ...

Zero Export to CT allows to provide power to my geyser/oven/SUB db during day time using PV (when available) instead of Eskom. Is there a way to still use "Zero Export to ...

Now next question: my Deye inverter is a SG01 version, which has a "meter con" port on the board. However when in "zero export to CT" work mode, I go to the settings to enable "Ex meter for CT", it lets me enable it but it does ...

I have some issue with the CT reading as well, and it seems to be multiple issue could be in the game. The cable to the CT extended with a shielded CAT6 cable, ...

In my case, I have 2 Deye inverters 8K in Parallel, the grid MCB is 30 Amps, so sometimes its getting down because Deye is returning power over 35 Amps. ... The Zero ...

The limiting factor is the VA rating of the CT itself. If the cables have a high impedance (long and small CSA) then the CT might get overloaded and the reading will be ...

I see it's something called zero export to ct, but I don't know what ct means? I just wanna use solar power at daytime and batteries/grid at night without feeding back to the grid. ...

Replaced 1.5 Surfix CT cable with CAT6 cable (using a pair for negative, and a pair for the postive) Moved CT cables from slot 3& 4 to 5& 6 on inverter Swapped the direction of the CT Swapped the cables (positive & ...
