## SOLAR PRO. Efficient inorganic organic hybrid heterojunction solar cells containing

How efficient are solar cells based on inorganic-organic hybrids?

Solar cells based on these inorganic-organic hybrids exhibit a power conversion efficiency of 12.0% under standard AM 1.5 conditions, with a short-circuit current density Jsc of 16.5 mA cm -2, Voc of 0.997 V, and fill factor of 0.727.

## Can an organic-inorganic hybrid solar cell improve the performance of OPV?

The addition of an inorganic acceptor material to form an organic-inorganic hybrid solar cell should theoretically improve the performance of OPV, due to additional advantages such as enhanced absorption and improved charge transport characteristics.

What are inorganic-organic hybrid structures?

Inorganic-organic hybrid structures have become innovative alternatives for next-generation dye-sensitized solar cells, because they combine the advantages of both systems.

Which inorganic semiconductors are used in hybrid solar cells?

Concerning inorganic semiconductors for hybrid solar cells, siliconis the most abundant. Some elements commonly used in photovoltaics have constraints on their availability, which could limit their suitability for large scale production. Tellurium and indium are two such elements. These are used in the compounds CdTe and CuInSe 2.

What are inorganic-organic hybrid dye-sensitized solar cells?

Inorganic-organic hybrid dye-sensitized solar cells feature a perovskite compound as a light harvester and a polymer as a hole transporter. These cells provide an open-circuit voltage of almost 1 V and a power conversion efficiency of 12% under standard illumination conditions.

How are hybrid solar cells different from organic solar cells?

The device fabrication and operation of hybrid solar cells is very similar to that of organic solar cells, the only difference being that the organic electron accepting material of PCBM (or other fullerene derivatives) is replaced by an inorganic nanoparticle.

: Inorganic-organic hybrid structures have become innovative alternatives for next-generation dye-sensitized solar cells, because they combine the advantages of both systems. ...

Heo, J. H. et al. Efficient inorganic-organic hybrid heterojunction solar cells containing perovskite compound and polymeric hole conductors. Nature Photon. 7, 486-491 (2013). Article ADS ...

In the past 2 years, organolead halide perovskites have emerged as a promising class of light-harvesting media in experimental solar cells, but the physical basis for their efficiency has been unclear (see the Perspective by
