

How many EV charging stations are there?

Almost every article in the mainstream American press about the state of electric vehicle (EV) adoption will include a comparison of the number of gas stations to the number of EV charging stations. The numbers used are usually something like 150,000 gas stations compared to less than 50,000 charging stations.

How do EV charging ports compare to gas station pump density?

Methodology The study used data from the U.S. Department of Energy and the U.S. Census Bureau to compare EV charging port density to gas station pump density in U.S. states. State-by-state comparisons were found by positioning the number of EV charging opportunities and gas stations against roadway miles, vehicle registrations, and square miles.

Are EV charging stations accessible?

As EV adoption continues to accelerate, one critical aspect that needs careful consideration is the accessibility and availability of EV charging stations. Steps have been taken over the years to ensure a network of accessible charging stations is available for those who need it.

Which state has the most EV charging stations?

Topping the list is Massachusetts, where EV stations exceed gas stations by the largest margin. In Massachusetts, there are 31.4 EV charging stations per 100 square miles and only 18.4 gas stations per 100 square miles.

What is EV charging density?

A density metric was created to highlight states with better EV charging density than gas station density, based on vehicle usage and charging/fueling accessibility, with assumptions for gas pump numbers from Enel X. The higher the value, the more difficulty someone with an EV will face trying to charge their car.

How does electric vehicle charging access vary across the country?

Electric vehicle charging access varies across the country. One of the most straightforward ways to understand that variability is by comparing EV adoption to available charging ports. States with more EVs on the road will need greater access to charging ports.
