

What are solid-state switches?

Solid-state switches are commercially available in modular packages of different operating voltage and current ratings for selection by designers according to specific application requirements.

What is a solid-state RF switch?

A solid-state RF switch is a type of RF switch with a solid-state design for hot switching RF signals with switching speeds in the microseconds. These switches, as mentioned in the text, have no moving parts, ensuring excellent reliability and repeatability that military applications require. Please contact our engineering team with your specific RF switching requirements.

What is a solid-state pressure switch?

A solid-state pressure switch is a type that uses strain gauge technology to provide over 50 million switch cycles with long-term stability and no drift. (Loading, please wait.... sign up today!)

What is a push-pull switch?

Push-pull switches are therefore the ideal choice in square wave pulse applications with high demands on the shape of pulses. BEHLKE switching modules are always galvanically isolated. They can be used as high-side switches for positive as well as for negative voltages.

What is a FQD ghts FHP FSWP?

The model series FQD, GHTS, FHPP and FSWP is a standard product line for "plug and play" solutions. All BEHLKE pulsers are designed for system integration, that means, the pulsers need a high voltage power supply and a control signal source for operation.

What is a fixed on-time switch?

Switches with fixed on-time are very cost-efficient and are used mainly in simple charge or discharge circuits. Due to their excellent EMC characteristics they are ideal switching elements in generator circuits for damped oscillations, especially in connection with the fast free wheeling diodes of the series FDA.
