How do APS micro-inverters work?

A PV system using APS Micro-inverters is simple to install. Each Micro-inverter easily mounts on the PV racking, directly beneath each PV module. Low voltage DC wires connect from the PV module directly to the Micro-inverter, eliminating the risk of high DC voltage. Installation shall comply with local regulations and technical rules.

What is a high voltage APsystems microinverter?

The voltage adds-up to reach high voltage value (from 600Vdc up to 1000Vdc) at the end of the PV string. This extreme high DC voltage brings a risk of electrical shocks or electrical arcs which could cause fire. When using an APsystems microinverter, PV modules are connected in parallel.

Are APS micro-inverters reliable?

The APS Micro-inverter system is more reliable than centralized or string inverters. The distributed Micro-inverter system ensures that no single point of system failure exists across the PV system. APS Micro-inverters are designed to operate at full power at ambient temperatures of up to 65°C.

Can APsystems microinverters connect PV modules in parallel?

When using an APsystems microinverter, PV modules are connected in parallel. Voltage at the back of each PV module never exceeds PV modules Voc, which is lower than 60Vdc for most of PV modules used with APsystems microinverters.

Do APS M1P micro-inverters work with PV modules?

The APS M1P series Micro-inverters connect with the single-phase grid, and operate with most 60 and 72 cell PV modules. For more information, please see the section 8 Technical Data of this manual. Max. #Per branch

What is a distributed APsystems microinverter system?

The distributed APsystems Microinverter system ensures that no single point of system failure exists across the PV system. APsystems Microinverters are designed to operate at full power at ambient outdoor temperatures of up to 65 deg C (or 149 F).

Micro-inverters enable single panel monitoring and data collection. They keep power production at a maximum, even with shading. Unlike string inverters, a poorly performing panel will not impact the energy production of other panels. ...

Also, if your system interconnection voltage is not 240 V single-phase or 208Y/120 V three-phase and you need to use transformers, the transformers may provide voltage taps to adjust the voltage by some percentage within your AC PV electrical system. Utility voltage: The utility strives to maintain voltage at the PCC within +/- 5% of nominal.

PV systems using APS Micro-inverters are safe to install and use. Micro-inverter eliminates the high DC voltage (600V~1000V) in conventional PV inverter system. This high DC voltage is lethal to installer and users. It also may cause DC arcing and result in fires. PV systems using APS Micro-inverters are very simple to install.

NOTE: Be sure to size the AC wire to account for voltage drop between the AC branch circuit junction box and the point of utility interconnection. Maximum external wiring distance (meter)

ditional wire run back to the main service tie-in, additional voltage drop calculations must be completed. A typical voltage drop limit is 3% for AC branch circuits; however, this is not adequate for utility-interactive inverters. Enphase recommends a voltage drop of less than 1.5 volts or 0.6 percent.

The consequence of too much AC voltage drop is that the inverter will experience voltage rise above grid voltage at its output terminals to compensate. If the grid voltage starts particularly high, this could nuisance trip its internal relays. If grid voltage starts particularly low, not as much of an issue. ... I cancelled the micro-inverters ...
