

What is mobile thermal energy storage (m-TES)?

Recent advancements in mobile thermal energy storage (m-TES) employing thermochemical materials have opened new avenues for enhancing the practicality and cost-effectiveness of solar thermal energy harnessing and waste heat recovery.

Can a mobile thermal energy storage device address off-site industrial waste heat recovery?

Closed-loop hot air flow of up to 400 °C utilized achieving a full charge in 10 h. 97 % discharging efficiency with a mean rate and temperature of 10 kW and 195 °C. This study concerns with a modelling led-design of a novel mobile thermal energy storage (M-TES) device aimed to address off-site industrial waste heat recovery and reuse in the UK.

What is mobilized thermal energy storage system?

Introduction Mobilized thermal energy storage system can be considered as an alternative for local heat sources and heating networks. It can be used in cooperation with conventional heat sources, but it can also be supplied with alternative heat sources.

What is the capacity of a mobile thermal energy storage device?

Conclusions This paper presents a model-based design study on a modular mobile thermal energy storage device with a capacity of approximately 400 MJ, utilizing composite phase change material modules.

How is thermal energy stored?

Thermal energy can be stored using sensible heat storage (SHS), latent heat storage (LHS), or thermochemical heat storage (THS). SHS is based on increasing the temperature of a liquid or solid media such as water, oil, molten salts, or rocks.

Can thermal energy storage systems be powered by heat from geothermal sources?

Mobilized thermal energy storage system can be powered by heat from geothermal sources. One of the main factors justifying the application of M-TES is the use of phase change materials (PCM) with the greatest possible heat accumulation capacity. This presents a large area for new research.
