

How to work with containers in SOL3?

working with containers in sol3 Containers are objects that are meant to be inspected and iterated and whose job is to typically provide storage to a collection of items. The standard library has several containers of varying types, and all of them have begin() and end() methods which return iterators.

What are the different types of containers in SOL3?

The standard library has several containers of varying types, and all of them have begin() and end() methods which return iterators. C-style arrays are also containers, and sol3 will detect all of them for use and bestow upon them special properties and functions.

What happens when you push a container into SOL3?

When you push a container into sol3, the default container handler deals with the containers by inspecting various properties, functions, and type definitions on them. Here are the broad implications of containers sol3's defaults will recognize, and which already-known containers fall into their categories:
