

What are AC solar panels?

AC solar panels are solar panels that come with a microinverter already attached to each panel. Every solar energy system needs an inverter in order to function properly. Why? Because solar panels convert sunlight into direct current (DC) electricity, but almost all homes use alternating current, or AC electricity, to run appliances.

Do solar panels need an inverter?

Every solar energy system needs an inverter in order to function properly. Why? Because solar panels convert sunlight into direct current (DC) electricity, but almost all homes use alternating current, or AC electricity, to run appliances. The inverter takes the DC electricity and converts it into usable AC power.

How does a solar inverter work?

The inverter converts the DC power from the solar panels into AC power that your AC unit can use. The advantage of this system is that you can still use your AC even if the solar panels are not generating enough power. Any excess energy produced can be sent back to the grid, which can reduce your electricity bill.

How do solar panels work?

Also known as a solar module, this rectangular equipment has a grid-like pattern of solar cells that absorb power from the sun, creating an electric charge. In a conventional solar system, solar panels send direct current (DC) to an inverter that changes the power to alternating current (AC) to match the electricity in our homes.

Does a solar inverter convert DC to AC?

Because solar panels convert sunlight into direct current (DC) electricity, but almost all homes use alternating current, or AC electricity, to run appliances. The inverter takes the DC electricity and converts it into usable AC power. [Learn more: The difference between DC and AC power](#)
