

What is solid waste management?

Solid waste management can be thought of as a chain of linked stages, as shown in Figure 9.1. The chain begins with the generation of waste by individual households, institutions and workplaces. This is Stage 1, which you learned about in Study Session 7.

What is a solid waste container?

Solid waste does not necessarily mean solid material, but rather anything that can be discarded without causing harm to human health and the environment. The following containers are typically used to haul non-toxic waste, such as garbage, debris, scrap, ocean/lake water and recyclable materials.

What is a semi-underground waste container?

Semi-underground waste containers have several advantages over fully underground containers, the most important being their flexibility. The MolokDomino system uses a unique rectangular waste division system which allows you to configure a single 5m<sup>3</sup> container in a seven different ways.

What is a waste collection system?

A waste collection system is a method of transporting waste containers to a transfer station, material recovery facility, or disposal site for direct discharge. This system is commonly used in areas with large waste containers and high waste generation rates.

Why use a waste management system?

Using a waste management system, such as the 7 Waste collection system, avoids waste accumulation and unsanitary conditions. It is particularly useful in areas with large waste containers and high waste generation rates, preventing the improper use of small containers.

What is a hauled container system?

A hauled container system is a waste collection method that uses a truck and driver to collect and transport waste to a processing or disposal site. This system is suitable for highly compressible waste and requires only one collector driver for collection and emptying containers.
