# The sole argument contains any value more than once python

What is a default argument in Python?

In Python, the default value of an argument is used inside a function if we do not pass a value to that argument at the time of the function call. Due to this, default arguments become optional during the function call. It overrides the default value if we provide a value to the default arguments during function calls.

How to use arguments in a Python function?

In Python, arguments can have default values. You can assign default values to the argument using the '=' (assignment) operator at the time of function definition. You can define a function with any number of default arguments. There are four types of function arguments in Python.

How many default arguments can a function have?

In Python,a function can have any number of default arguments. If a value is not provided for a default argument during the function call, its default value will be used.

What does function got multiple values for argument mean in Python?

The error message "Function got multiple values for argument" comes in Python when we call a function with more than one value for the same argument. Let me explain it with a example. I have created a function called my\_function which needs two argument when called. The function just returns sum of two numbers which were passed. Return a+b
