

Why are California's solar power curtailments increasing?

California's solar power curtailments have been increasing due to the growth in solar power to meet the state's aggressive clean energy goals. As of the first quarter 2021, California had more than 31,800 megawatts of solar, generating almost 24 percent of the state's electricity according to the Solar Energy Industries Association.

How much solar power does California have?

California had almost 31,800 megawatts of solar power as of the first quarter 2021, generating about 24 percent of the state's electricity according to the Solar Energy Industries Association. California has the largest solar market in the United States.

Does California have too much solar power?

California has too much solar power. That might be good for ratepayers. The Beacon solar farm in California's Kern County generates electricity for the Los Angeles Department of Water and Power.

Are California's solar farms wasting energy?

Despite the high prices, the Times found that California's solar farms have curtailed production -- meaning slowed or stopped -- of more than 3 million megawatt hours over the past 12 months. That's more than twice the amount from 2021, per the outlet, and is enough wasted energy to power 518,000 average Californian homes for a year.

Should California stop producing solar energy?

California is now producing so much solar energy that the state must increasingly ask solar farms to stop producing to prevent overloading the electric grid. In the last 12 months, power that would have fueled 518,000 California homes for a year has been curtailed or thrown away.

What if California didn't pay utilities for solar energy?

The waste would have been even larger if California had not paid utilities in other states to take the excess solar energy, documents from the state's grid operator show. That means green energy paid for by California electricity customers is sent away, lowering bills for residents of other states.

On the one hand, utilities have eyed such projects warily, fearing that if the solar panels or batteries inject too much power onto local circuits at moments when electricity demand is low, it might cause grid instability or ...

New research published in the peer-reviewed journal Solar Energy suggests California should embrace the idea of building more solar panels ...

As California works toward its ambitious clean energy vision, an almost counterintuitive challenge has emerged: The state is, at times, generating more solar energy than it can handle.

In recent years in California, the duck curve has become a massive, deep canyon -- and solar power is going unused. In 2022, the state wasted 2.4 million megawatt-hours of electricity, 95 ...

In 2022, the California wasted 2.4 million megawatt-hours of electricity, 95 percent of which was solar-about 1 percent of the state's overall annual power generation, or 5 ...

California should meet as much of that increased demand as possible from rooftop solar and batteries, and make up the difference with solar farms. That will reduce the need for the utility to spent ratepayer money on ...

Solar farms are being shut off, losing more than twice as much potential power than in 2021. The surplus would be worse if utilities weren't paying other states to take some of the ...

Solar energy records are falling left and right in California these days, as the state steams ahead toward its ambitious renewable energy goals. But the success of solar has brought about a hidden downside: on some ...

The end of California's drought is exposing the full effect of the state's move to renewable energy. A wet winter has loaded up the hydroelectric system, while solar generation ...

California's power-grid operators are dealing with a glut of daytime electricity produced by household, government, business and industrial solar installations.This forces the electricity prices ...

The state of California has set an ambitious goal of getting all of its energy from clean sources by 2045.As the Times investigation makes clear, there are several factors at play that could make that challenging -- including ...

As California works towards its ambitious clean energy vision, an almost counterintuitive challenge has emerged: The state is, at times, generating more solar than it ...

California set two renewable energy records last week: the most solar power ever flowing on the state's main electric grid, and the most solar power ever taken offline because it wasn't needed.

As California strives to meet its ambitious clean energy goals, it has encountered an unexpected challenge: too much solar power. The state has also put a lot of capital into renewable energy generation, specifically solar farms, ...

The dreaded curtailment in California on March 27, 2016. This doesn't happen all that often yet -- roughly 2.2 GWh of renewable energy were curtailed due to oversupply in 2014, relative to the 44,000 GWh of renewable energy the grid ...

The cost of solar power has plummeted in recent years, which has led to a renewable energy boom in California. But there's a big hang-up: solar energy doesn't provide a 24-hour supply. When the sun sets, the power from ...

The CPUC's disastrous decision at the behest of the state's big three investor-owned power companies to quash California's wildly successful solar program has decimated the state's once-booming solar industry. It has ...

California, which leads the nation in solar power energy, is among those states to have too much leftover energy that is now being wasted. In 2022, 2.4 million megawatt-hours ...

California's home solar net metering standards changed last year and crashed the solar industry. ... until such time as there is too much solar power and they need to limit it. With non-solar ...

When California undercut its own rooftop solar market one year ago, it surrendered a crucial tool for achieving its ambitious climate goals.. For the last two decades, California set the national standard for clean energy policy. ...
